Changes in Risk-o-meter

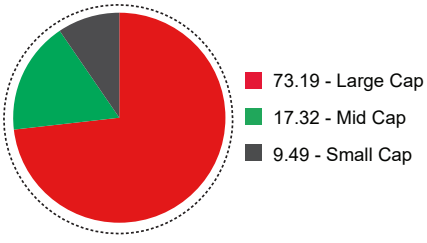

Change In	Previous Month	Current Month
Scheme	NA	NA
Benchmark	NA	NA

	Quantitative Measures /Risk Measures	Brief description/ Inference of the Quantitative measure
1	Standard Deviation	Standard deviation is a statistical tool that measures the deviation or dispersion of the data from the mean or average. When seen in mutual funds, it tells you how much the return from your mutual fund portfolio is straying from the expected return, based on the fund's historical performance.
2	Beta	Beta is a measure of an investment's volatility in comparison to the market. Beta of less than 1 means that the security will be less volatile than the market. A beta of greater than 1 implies that the security's price will be more volatile than the market.
3	Sharpe Ratio	The Sharpe Ratio, is measure of risk-adjusted returns. It is calculated using standard deviation and excess return to determine reward per unit of risk.
4	Information Ratio	Measures the consistency of excess returns generated over the benchmark relative to tracking error. A higher ratio indicates better risk-adjusted benchmark outperformance.
5	Portfolio Turnover Ratio	Measures the extent of purchase and sale of securities in the portfolio during a specified period. A higher portfolio turnover ratio indicates more frequent trading and portfolio rebalancing.

^Benchmark ^^Additional Benchmark. CAGR – Compounded Annual Growth Rate. Inception/Allotment date: 18-Oct-16. Past performance may or may not be sustained in future and should not be used as a basis of comparison with other investments. Returns greater than 1 year period are compounded annualized. For SIP returns, monthly investment of equal amounts invested on the 1st business day of every month has been considered. CAGR Returns (%) are computed after accounting for the cash flow by using the XIRR method (investment internal rate of return).

Past Performance is not an indicator or guarantee of future results
